Introduction to Database Systems

Nested Queries in SQL

Lecture Goals

 Today we will learn how to write (even) more powerful SQL queries

• Reading: Ch. 6.3

Subqueries

- A subquery is a SQL query nested inside a larger query
 - such inner-outer queries are called nested queries
- A subquery may occur in:
 - A SELECT clause
 - A FROM clause
 - A WHERE clause
- Rule of thumb: avoid nested queries when possible; keep in mind that sometimes it's impossible
 - (though use in FROM is often not as bad)

Subqueries...

- Can return a single constant and this constant can be compared with another value in a WHERE clause
- Can return relations that can be used in various ways in WHERE clauses
- Can appear in FROM clauses, followed by a tuple variable that represents the tuples in the result of the subquery
- Can appear as computed values in a SELECT clause

1. Subqueries in SELECT

```
Product (<u>pname</u>, price, cid)
Company(<u>cid</u>, cname, city)
```

For each product, return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city
FROM Company Y
WHERE Y.cid=X.cid) as City
FROM Product X
```

What happens if the subquery returns more than one city? We get a runtime error

(SQLite simply ignores the extra values)

1. Subqueries in SELECT

Product (<u>pname</u>, price, cid) Company(<u>cid</u>, cname, city)

For each product return the city where it is manufactured

```
SELECT X.pname, (SELECT Y.city
FROM Company Y
WHERE Y.cid=X.cid) as City
FROM Product X

"correlated subquery"
```

What happens if the subquery returns more than one city? We get a runtime error

(SQLite simply ignores the extra values)

1. Subqueries in SELECT

Whenever possible, don't use nested queries:

```
SELECT X.pname, (SELECT Y.city
FROM Company Y
WHERE Y.cid=X.cid) as City
```

FROM Product X

П

SELECT X.pname, Y.city FROM Product X, Company Y WHERE X.cid=Y.cid DBMS also does this...

We have "unnested" the query

1. Subqueries in SELECT

Compute the number of products made by each company

```
SELECT DISTINCT C.cname, (SELECT count(*)
FROM Product P
WHERE P.cid=C.cid)
FROM Company C
```

Better: we can unnest by using a GROUP BY

SELECT C.cname, count(*)
FROM Company C, Product P
WHERE C.cid=P.cid
GROUP BY C.cname

1. Subqueries in SELECT

But are these really equivalent?

```
SELECT DISTINCT C.cname, (SELECT count(*)
FROM Product P
WHERE P.cid=C.cid)
FROM Company C
```

SELECT C.cname, count(*)
FROM Company C, Product P
WHERE C.cid=P.cid
GROUP BY C.cname

No! Different results if a company has no products

```
SELECT C.cname, count(pname)
FROM Company C LEFT OUTER JOIN Product P
ON C.cid=P.cid
GROUP BY C.cname
```

2. Subqueries in FROM

Find all products whose prices is > 20 and < 500

```
SELECT X.pname
FROM (SELECT * FROM Product AS Y WHERE price > 20) as X
WHERE X.price < 500
```

Unnest this query!

```
SELECT pname
FROM Product
WHERE price > 20 AND price < 500
```

2. Subqueries in FROM

- We will see that sometimes we really need a subquery
 - will see most compelling examples next lecture
 - in that case, we can put it in the FROM clause

3. Subqueries in WHERE

Find all companies that make <u>some</u> products with price < 100

Existential quantifiers

```
Using EXISTS:
```

```
SELECT DISTINCT C.cname

FROM Company C

WHERE EXISTS (SELECT *

FROM Product P

WHERE C.cid = P.cid and P.price < 100)
```

3. Subqueries in WHERE

Find all companies that make <u>some</u> products with price < 100

Existential quantifiers

```
Using IN
```

```
SELECT DISTINCT C.cname
FROM Company C
WHERE C.cid IN (SELECT P.cid
FROM Product P
WHERE P.price < 100)
```

3. Subqueries in WHERE

Find all companies that make <u>some</u> products with price < 100

Existential quantifiers

Using ANY:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE 100 > ANY (SELECT price
FROM Product P
WHERE P.cid = C.cid)
```

Not supported in sqlite

3. Subqueries in WHERE

Find all companies that make <u>some</u> products with price < 100

Existential quantifiers

Now let's unnest it:

```
SELECT DISTINCT C.cname
FROM Company C, Product P
WHERE C.cid= P.cid and P.price < 100
```

Existential quantifiers are easy ! ©

3. Subqueries in WHERE

Find all companies where <u>all</u> their products have price < 100

same as:

Find all companies that make only products with price < 100

Universal quantifiers

Universal quantifiers are hard!

3. Subqueries in WHERE

Find all companies where <u>all</u> their products have price < 100

1. Find *the other* companies with <u>some</u> product having price ≥ 100

```
SELECT DISTINCT C.cname
FROM Company C
WHERE C.cid IN (SELECT P.cid
FROM Product P
WHERE P.price >= 100)
```

2. Find all companies where <u>all</u> their products have price < 100

```
SELECT DISTINCT C.cname
FROM Company C
WHERE C.cid NOT IN (SELECT P.cid
FROM Product P
WHERE P.price >= 100)
```

3. Subqueries in WHERE

Find all companies where <u>all</u> their products have price < 100

Universal quantifiers

Using EXISTS:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE NOT EXISTS (SELECT *
FROM Product P
WHERE P.cid = C.cid and P.price >= 100)
```

3. Subqueries in WHERE

Find all companies where <u>all</u> their products have price < 100

Universal quantifiers

Using ALL:

```
SELECT DISTINCT C.cname
FROM Company C
WHERE 100 >= ALL (SELECT price
FROM Product P
WHERE P.cid = C.cid)
```

Not supported in sqlite

Question for Database Fans and their Friends

- Can we unnest the universal quantifier query?
 - No

Monotone Queries

- Definition: A query Q is monotone if:
 - Whenever we add tuples to one or more input tables, the answer to the query will not lose any of the tuples

Product

pname	price	cid
Gizmo	19.99	c001
Gadget	999.99	c004
Camera	149.99	c003

Company

cid	cname	city
c002	Sunworks	Bonn
c001	DB Inc.	Lyon
c003	Builder	Lodtz

А	В
Gizmo	Lyon
Camera	Lodtz

Product

pname	price	cid
Gizmo	19.99	c001
Gadget	999.99	c004
Camera	149.99	c003
iPad	499.99	c001

Company

cid	cname	city
c002	Sunworks	Bonn
c001	DB Inc.	Lyon
c003	Builder	Lodtz

А	В
Gizmo	Lyon
Camera	Lodtz
iPad	Lyon

Monotone Queries

- Theorem: If Q is a SELECT-FROM-WHERE query that does not have subqueries, and no aggregates, then it is monotone.
- Proof. We use the nested loop semantics: if we insert a tuple in a relation R_i, this will not remove any tuples from the answer

```
SELECT a_1, a_2, ..., a_k
FROM R_1 AS x_1, R_2 AS x_2, ..., R_n AS x_n
WHERE Conditions
```

```
\begin{array}{c} \text{for } x_1 \text{ in } R_1 \text{ do} \\ \text{ for } x_2 \text{ in } R_2 \text{ do} \\ & \dots \\ \text{ for } x_n \text{ in } R_n \text{ do} \\ & \text{ if Conditions} \\ & \text{ output } (a_1, \dots, a_k) \end{array}
```

Monotone Queries

The query:

Find all companies where <u>all</u> their products have price < 100 is not monotone

pname	price	cid
Gizmo	19.99	c001

cid	cname	city
c001	Sunworks	Bonn

cname	
Sunworks	

pname	price	cid
Gizmo	19.99	c001
Gadget	999.99	c001

cid	cname	city
c001	Sunworks	Bonn

 <u>Consequence</u>: we cannot write it as a SELECT-FROM-WHERE query without nested subqueries

Queries that must be nested

(that is, cannot be SFW queries)

- Queries with universal quantifiers or negation
- Queries that use aggregates in usual ways are not monotone
 - Note: sum(..) etc. are NOT monotone
 - select count(*) from R is not monotone!
